(residues 1-67) and the persephin fragment (residues 64-96) (SEQ ID NO:146) with the arrow indicating the crossover point in each;

Figure 21 illustrates the survival promoting effect of persephin in murine embryonic day-14 mesencephalic cells cultured for three days (a) in the absence of persephin where almost all of the cells are dead and (b) in the presence of persephin (100 ng/ml) where substantial neuronal cell survival is evident;

Figure 22 illustrates the survival promoting effect of persephin (PSP) in murine embryonic day-14 mesencephalic cells compared to effects of neurturin (NTN) and GDNF, measured by the number of cells stained with tyrosine hydroxylase (TOH);

Figure 23 illustrates RT/PCT survey for persephin expression in adult mouse tissues showing persephin expression by Kidney cells; and

Figure 24 illustrates the cDNA sequence of human pre-pro persephin (SEQ ID NO:203) with two silent mutations indicated at positions 30 and 360 and the encoded amino acid sequence (SEQ ID NO:217) with the first amino acid of the pro- region indicated by the double asterisks (**) at amino acid position 24 and the first amino acid of mature human persephin indicated by the single asterisk (*) at amino acid position 61.

Description of the Preferred Embodiments

The present invention is based upon the identification, isolation and sequencing of a DNA molecule that encodes a new growth factor, persephin. Persephin promotes cell survival and, in particular, the survival of neuronal cells. Prior to this invention, persephin was unknown and had not been identified as a discrete biological substance nor had it been isolated in pure form.

AMENDED SPECIFICATION

35

neurturin and persephin make possible this powerful new approach which can now successfully identify other gene family members. Using this new approach, one may screen for genes related to GDNF, neurturin and persephin in sequence homology by preparing DNA or RNA probes based upon the conserved regions in the GDNF and neurturin molecules. Therefore, one embodiment of the present invention comprises probes and primers that are unique to or derived from a nucleotide sequence encoding such 5 conserved regions and a method for identifying further 10 members of the neurturin-persephin-GDNF gene family.

Conserved-region amino acid sequences have been identified herein to include Val-Xaa₁-Xaa₂-Leu-Gly-Leu Gly-Tyr where Xaa₁ is Ser, Thr or Ala and Xaa₂ is Glu or 15 Asp (SEQ ID NO:108); Glu-Xaa₁-Xaa₂-Xaa₃-Phe-Arg-Tyr-Cys-Xaa₄-Gly-Xaa₅-Cys in which Xaa₁ is Thr, Glu or lys, Xaa₂ is Val, Leu or Ile, Xaa₃ is Leu or Ile, Xaa₄ is Ala or Ser, and Xaa₅ is Ala or Ser, (SEQ ID NO:113); and Cys-Cys-Xaa₁ 20 Pro-Xaa₂-Xaa₃-Xaa₄-Xaa₅-Asp-Xaa₆-Xaa₇-Xaa₈-Phe-Leu-Asp-Xaa₉, in which Xaa₁ is Arg or Gln, Xaa₂ is Thr or Val or Ile, Xaa₃ is Ala or Ser, Xaa₄ is Tyr or Phe, Xaa₅ is Glu, Asp or Ala, Xaa₆ is Glu, Asp or no amino acid, Xaa₇ is val or leu, Xaa₈ is Ser or Thr, and Xaa₉ is Asp or Val (SEQ ID NO:114). Nucleotide sequences containing a coding 25 sequence for the above conserved sequences or fragments of the above conserved sequences can be used as probes. Exemplary probe of [and] primer sequences encoding amino acid sequences of SEQ ID NOS:125-129; primers whose reverse complementary sequences encode amino acid sequences SEQ 30 ID NO:126, SEQ ID NO:127, SEQ ID NO:130; and, in particular, nucleotide sequences, SEQ ID NOS:115-124. Additional primers based upon GDNF and neurturin include nucleic acid sequences encoding amino acid sequences, SEQ ID NO:33, SEQ ID NO:36, SEQ ID NO:40 and SEQ ID NO:41; 35 primers whose reverse complementary sequences encode SEQ

AMENDED SPECIFICATION

56

expressing the persephin gene. Certain tissues such as those identified below in example 18 have been found to express the persephin gene. The method comprises hybridizing a polynucleotide probe to mRNA from a sample 5 of tissue that normally express the persephin gene or from a cDNA produced from the mRNA of the sample. The sample is obtained form a patient suspected of having an abnormality in the persephin gene or from a particular patient tissue or cell type suspected of having an 10 abnormality in the persephin gene. The reference persephin polynucleotide probe can comprise a cDNA encoding the complete mouse persephin open reading frame SEQ ID NO:179, or the complement thereof, SEQ ID NO:180; a cDNA encoding the complete rat persephin open reading frame (SEQ ID NO:190 or the complement thereof, SEQ ID NO:191); cDNA encoding complete 15 human persephin open reading frames (SEQ ID NOS:203 or 205, or their respective complements, SEQ ID NOS:204 or 206) [SEQ ID NO:179 and the respective complement of (SEQ ID NO:180), SEQ ID NO:190 and the respective complement (SEQ ID NO:191), SEQ ID NO:203-206] or 20 derivatives thereof or fragments thereof so long as such derivatives or fragments specifically hybridize to persephin mRNA or from a cDNA produced from a persphine mRNA.

To detect the presence of mRNA encoding persepin protein, a sample is obtained from a patient. The sample 25 can be from blood or from a tissue biopsy sample. The sample may be treated to extract the nucleic acids contained therein. The resulting nucleic acid from the sample is subjected to gel electrophoresis or other size separation techniques.

30 The mRNA of the sample is contacted with a nucleic acid serving as a probe to form hybrid duplexes. The use of a labeled probes as discussed above allows detection of the resulting duplex.

When using cDNA encoding persephin protein or a 35 derivative of the cDNA as a probe, high stringency conditions can be used in order to prevent false positives, that is the hybridization and apparent

AMENDED SPECIFICATION

56 A

detection of persephin nucleotide sequences when in fact an intact and functioning persephin gene is not present. When using sequences derived from the persephin cDNA, less stringent conditions could be used, however, this would be a less preferred approach because of the
